

Waygr — Growth loop

The loop

Waygr grows when one person's challenge puts the app in front of someone new, and that person sends their own challenge within a week. Everything in this doc exists to raise those two numbers.

flowchart TD

```
A[Sam sends a challenge<br/>to the group chat] --> B[Jordan opens the link]
B --> C[Jordan accepts<br/>no install]
C --> D[Game settles<br/>result card lands in chat]
D --> E[Rest of the chat sees it]
E --> F[Rematch]
F --> G[Someone new sends<br/>their own challenge]
G --> A
H --> A
```

Four loops, in order of importance:

Loop	Trigger	What spreads
Invite	A challenge sent to someone not on Waygr	The app itself, through the link
Content	Every settled challenge	Result cards and forfeit proof, into chats and onto Instagram and TikTok
Rivalry	The next game involving a team either person picked	A nudge: "Sam leads you 4–3. Chiefs play Sunday."
Room	A QR code on the TV at a watch party	Everyone in the room joins with one scan

Rules that make the invite loop work:

1. **The link preview does the selling.** It renders the real matchup, the call and the forfeit, never a generic app card.
2. **Tap to "You're on" in under 15 seconds.** Sign in with Apple or Google, or a phone code. Name and avatar come from the sign-in.

3. **Challenges read in the sender's voice.** "Sam says the Chiefs cover –3.5. Loser wears the other team's colors for a week. You in?"
4. **The next challenge is ready before the first one ends.** After accepting, show "Your turn" with three pre-built calls on tonight's games.
5. **No contact spam.** Waygr never messages anyone on its own; people share through the native share sheet. Spammy invites burn the chat's trust in every future link.

Share cards

The cards are the ad budget. Each is an image plus a link, rendered server-side the moment it's needed. Link previews render at 1200×630, the Open Graph size chat apps expect; result cards export at 1080×1350 for chats and feeds and 1080×1920 for stories.

Card	When	What it shows	Where it goes
Challenge	On send	Both avatars, the matchup, the call, the forfeit, "You in?"	Link preview in iMessage, WhatsApp, Slack
Live	Lead change on the call	Score, who's winning the challenge, time left	Optional share from the live page
Called it	Settle, to the winner	"Called it." Winner, final score, record against this rival	Chat or story
Concession	Settle, loser pays	"I was wrong about the Cowboys." Loser's avatar in the winner's colors	The chat; sending it is the forfeit
Proof	Custom forfeit done	The loser's photo or video framed with the terms and the score	Chat, Instagram, TikTok (9:16 video)

Card rules: people and score big, one line of copy, wordmark small in one corner. Every card has to read at thumbnail size, because that's how most people first see it.

Rooms

A room is a live board for everyone watching the same game in the same place: a watch party, a tailgate, an office, a bar. Bars are one kind of room, not the channel.

Phase 2 flow: the host taps "Start a room" and puts its QR on the TV or a printed card.

Anyone who scans joins that game's board, can take open challenges from anyone in the room, and sees the room's standings. The night ends with a room card ("Sunday at Maya's: Dev went 5–1").

One host can turn a party into 10 to 30 new users in an evening, and they go home with rivals they'll challenge from the couch. Rooms in bars follow the same guardrails: forfeits only, no prizes, no drinks as stakes.

Launch calendar and seed groups

Launch into a moment, not a date. A new app gets tried when the group chat is already loud.

When	Moment	Goal
Nov 26, 2026	Thanksgiving NFL slate: three games, everyone off work	Private beta: 3 to 5 seed chats, about 50 people
Dec 2026 – Jan 2027	Bowl season, College Football Playoff, NFL playoffs	Fix what beta broke; reach 300 people through invites alone
Feb 2027	Super Bowl LXI	First public push: one game, everyone watching, endless props
Mar 2027	March Madness	The big swing: weeks of games, office pools, loud chats

What makes a good seed chat:

- 8 to 30 people who already talk sports most days.
- Mixed loyalties. A chat of all Longhorns fans has nobody to take the other side.
- At least two people who argue about games for fun.
- One member who posts the first challenge on day one, ideally you.

Your McCombs cohort chats fit this profile well. Hold off on paid marketing until k-factor clears 0.5. After that, the content is forfeit proof people already film: repost the best ones (with permission) from a Waygr account on TikTok and Instagram.

Metrics and targets

These are our targets, not industry benchmarks. Setting them now gives beta a pass/fail line. Every metric comes from the analytics events in the build brief, instrumented from day

one.

Metric	Definition	Beta target	March target
Link accept rate	Challenges accepted ÷ challenge links opened by non-users	30%	40%
Time to "You're on"	Median seconds from link open to accept, new users	Under 20 s	Under 15 s
Activation	New users who send their own challenge within 7 days	35%	45%
k-factor	New accepting users per weekly active challenger, per week	0.5	1.0
Rematch rate	Settled challenges followed by a rematch within 7 days	30%	40%
Share rate	Settled challenges where a result card gets shared	25%	35%
Forfeit paid rate	Forfeits paid ÷ forfeits owed	60%	70%
Week-4 retention	New users still active in their fourth week	20%	25%

If k-factor sits under 0.3 after four weeks of beta, stop adding features and fix the path from link to accept. That path is the whole business.
